CSC4370/6370 FALL 2019 FINAL PROJECT 4 E-COMMERCE USING PHP-MVC

ALL GROUPS EMAIL YOUR YOUTUBE LINK BY 12/11/2019

11:59PM

Submission Requirements

You must turn work at the SPECIFIED TIME so you can receive credit for Homework!

You must be submit the YouTube URL by the due date and time to the drop box located in icollege. Late submission will be subject to a zero, as stated in the course grading policy.

You may discuss the assignments with other students in the class, but (as stated in the academic honesty policy) your written answers must be your own, and you must list the names of other students you discussed the assignment with.

How to Submit

Log into (ICollege), select the class to view its drop box folders, select the correct folder for the given assignment and upload the file there.

(Please submit link of project 4 to ICollege drop box this applies to all members AND the TEST CASE)

Requirements

You shall choose one team member as leader for purposes of coordinating the project and reporting to the instructor.

Each team shall make a presentation lasting five minutes or less in which you present your completed project. At the beginning of the

ATTACHED to submission Presentation sheet (Do so as link embedded in you txt submission file)

The leader shall present to the instructor a single sheet of paper which states the following:

- **➤** Leader's Name
- > Project Name

Description: a one-sentence description of your project

SUBMISSION REQUIREMENT

Create a YouTube Video: "Name of the task CSS Project 03_TeamName"

- 1. This video must range for 8 10 minutes in presenting which will include the demo
- 2. and code snippets of your project. You will lose points if it is more than 8 minutes.
- 3. Every team member must participate in this video if a member is missing that member will earn a grade of zero.
- 4. Be sure to show several clips during the life cycle development failure will result in deduction of points)
- 5. Use your smart phone camera. Make sure the voice is clear.
- 6. Create a channel at YouTube and name it as your group name
- 7. Once ready, upload the video to your channel -Include the link to this channel with your submission and you will
- 8. Incorporate the video for the core of your PowerPoint presentation.
- 9. Use this channel for uploading future videos.

TOPIC – (5-10 extra points for the use of React, Mongo & Node JS framework instead of PHP and MYSQL)

AN ONLINE VIRTUAL AGENT THAT PROVIDES THE FOLLOWING:

Undergraduate: - Pick 1 of the first 2 features below along with Pre-Pay Parking services.

Graduate: Do ALL THREE (3) Features

Objective: Travel booking to anywhere to visit a destination

- 1. Book flights (choose their seating should show the availability)
- 2. Select rental car (Type- SUV, Compact, Midsize, and Luxury)
- 3. Pre-pay for the parking Services This system should show the availability of parking along with a variation of prices based up when time frame of purchase, space accommodation and along with a VIP section.

4. *Bonus (Display trending now if you have selected the parking section). This can also be in form a Kiosks implement your own method.

Please be sure to create a sound method of managing the facility

This system will simulate the automation of a real scenario

Please be mind-full that this is a **VIRTUAL AGENT** application. There are users and an inventory. As a user selects items from the inventory, they are added to their shopping cart etc. When the user checks out, the shopping cart is turned into an order.

Use the **MVC** framework to model your application. This means you will use PHP for your views, control, and for the model.

*** Try to present your project on your local sever and NOT CODD server however you can just use CODD for the database***

Auto-detecting Credit Card Type

This credit card type detection is a nice addition to the standard payment form because it frees up the user from entering what is actually redundant information

Use data structure called an inversion map from the Google Closure Library. This data structure maps integer ranges to values, a perfect fit for mapping card number prefixes to card types. This card detection code isn't restricted to regular expression syntax, so it's free to declaratively mirror the original card number ranges before being transformed and assembled into the final data structure.

Fields for Card Entry

- Credit Card from should have
- > Your name
- Credit card type
- > Credit card number
- > Expiration date
- > Extra Feature Coupon or discounts

Second Form fields as it relates to the Credit Card

- ➤ Address
- ➤ Billing Address
- > Phone number

What's in a Credit Card Number?

Despite looking somewhat random, credit card numbers are actually governed by strict conventions. There is a standard called ISO/IEC 7812 that specifies the format for identification numbers on credit cards as well as other card-based identification numbers. The entire identification number is separated into three parts:

Issuer Identification Number (IIN). The IIN is the first four to six digits of the overall identification number and it represents the company that issued the card. In the case of credit cards, the IIN represents the issuing bank.

Account Number. The next few numbers are your personal identification number. For credit cards, this is your account number.

Check Digit. The very last digit is used to verify the overall validity of the identification number. Calculations are used with the preceding numbers to determine that the number format is correct.

Consider the sample MasterCard number 5555-5555-5555-4444 (don't worry, all banks have sample credit card numbers you can use for testing purposes). The first four digits, 5555, is the IIN representing the fake bank issuing the MasterCard. The numbers 5555-5555-444 are the individual account number and the last 4 is the check digit.

Detecting Credit Card Type

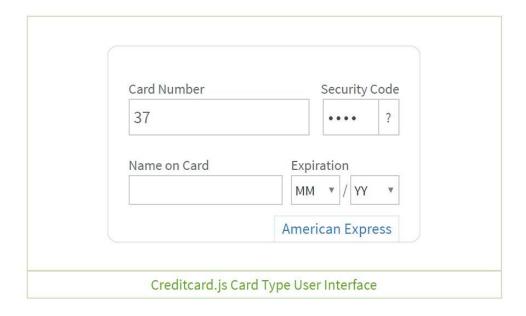

The interesting thing about the IIN is that it also determines the type of credit card.

Here are some common IIN patterns:

- ➤ MasterCard IINs have the first two digits in the range 51-55
- > Visa IINs always begin with a 4
- ➤ American Expression IINs always begin with 34 or 37

Knowing this, it's possible to write a simple JavaScript function to determine the type of credit card given an account number.

Please implement this approach by displaying the detected card type in the bottom right of the credit card form

The use of large text instead of small icons creates a more readable interface. The text is styled just enough to be noticeable experiment with transitioning so when you start typing the Card logo can now be displayed at the bottom of the form.

Here are some demo images you can use to display

******PLEASE NOT ALL GRADUATE STUDENT ARE REQUIREED TO

CREATE AN EXTRA FEATURE (CREATE YOU OWN FUNCTIONALITY WHAT IS NOT DISCRIBED BY ME)

Requirements:

- 1. See above
 - 1. Stuff
 - 2. Things
 - 3. Project requirements

Upload on your YouTube channel.
